

SHCreateProcessAsUserW

Use fully qualified executable filename. Do not depend on the shell's heuristics to locate the file.

Attack Category	<ul style="list-style-type: none">• Path spoofing or confusion problem		
Vulnerability Category	<ul style="list-style-type: none">• Indeterminate File/Path• Process management		
Software Context	<ul style="list-style-type: none">• Shell Functions• Process Management		
Location	<ul style="list-style-type: none">• shlobj.h		
Description	<p>When calling SHCreateProcessAsUserW(), care must be exercised to ensure an unauthorized executable cannot end up getting run.</p> <p>SHCreateProcessAsUserW() creates a new user-mode process and its primary thread to run a specified executable file. If the file to be executed is not fully specified, heuristics are used to try to find the file. Do not depend on the shell's heuristics to locate the file, as this can create vulnerabilities to attacks.</p> <p>Make sure you provide an unambiguous definition of the application that is to be executed. The executable filename should be fully qualified, including the file extension.</p> <p>If any elements of the command line string contain white space, wrap them in double quotes. Otherwise, the parser might interpret an element containing one or more spaces as multiple separate elements.</p>		
APIs	Function Name		Comments
	SHCreateProcessAsUserW		Not supported under XP
Method of Attack	An attacker could inject a Trojan horse executable into the system by placing a "tainted" executable in a location in the search path that is found before the intended executable.		
Exception Criteria			
Solutions	Solution Applicability	Solution Description	Solution Efficacy
